ABSTRACT

The News & Social Media Analytics Engine is a data-driven system designed to efficiently process, organize, and analyze large volumes of news articles and social media posts. The system provides features such as searching for relevant news articles, detecting duplicate content, clustering related stories, assigning moderators, and processing millions of posts efficiently. It applies suitable data structures and algorithms to improve the speed and efficiency of data storage, searching, retrieval, sorting, and processing.

Hash tables can be used for fast searching and duplicate detection, while heaps and priority queues can support ranking and prioritization. Trees can help organize searchable data, queues can manage incoming posts, and graphs can represent relationships between users, topics, and content. The system demonstrates the practical application of Data Structures and Algorithms to a real-world media analytics problem. It aims to improve content organization, reduce redundant information, support efficient moderation, and provide faster analysis of large-scale news and social media data.
